

AE4-204 Guest Lecture

Date : Friday 27th March, 2026

Time : 11:45 – 12:30

Where: Room AE-Hall E (62.NB.0.002)

Real-World Insights: Application of the ParaPy KBE Platform in Industry

by **Reinier van Dijk, M.Sc. - CEO & Co-founder ParaPy B.V.**

Knowledge-Based Engineering (KBE) enables the development of knowledge-intensive applications that accelerate the design of complex products through automation. While its potential as a “way of working” is widely recognized, KBE as a technology has yet to reach its full impact. [ParaPy](#) aims to unlock this potential by delivering a platform that is more accessible, versatile, and affordable than traditional solutions.

In this lecture, Reinier van Dijk will showcase real-world applications of ParaPy in industry and highlight why organizations choose a structured KBE platform over ad-hoc development approaches.

Looking ahead, the talk will introduce ParaPy’s vision of a process-centric engineering model that enhances collaboration between teams and their automation tools. Recent innovations will also be highlighted, including the use of AI to accelerate application development and the concept of a Single Source of Truth (SSOT) as a semantic data model for highly iterative engineering processes.

The lecture will conclude with the announcement of the **10th KBE Challenge**, offering participants the opportunity to showcase their skills to a professional jury and compete for the title of TU Delft KBE Champion.

Reinier van Dijk is co-founder and CEO/CTO of ParaPy. Founded in 2016, ParaPy is located at the Buccaneer accelerator, and actively developing and licensing its ParaPy software to industry. The company has expanded its original business from the aerospace sector into other high-tech areas like offshore, maritime and construction. Mr van Dijk holds an MSc in aerospace engineering and is at the final stages of completing a PhD in Knowledge Based Engineering at Delft University of Technology. His research has focused on tools and methods to make KBE more accessible to industry. ParaPy is logical spin-off product aimed at making KBE more accessible to a larger audience of engineers.
